Routes - UI

```
# UI
                                                    controllers.Accounts.index()
GET
GET
        /signup
                                                    controllers.Accounts.signup()
GET
        /login
                                                    controllers.Accounts.login()
GET
       /logout
                                                    controllers.Accounts.logout()
POST
       /register
                                                    controllers.Accounts.register()
POST
        /authenticate
                                                    controllers.Accounts.authenticate()
                                                    controllers.Dashboard.index()
GET
        /dashboard
        /upload
                                                    controllers.Dashboard.uploadActivityForm()
GET
        /submitactivity
                                                    controllers.Dashboard.submitActivity()
POST
```

- Routes to deliver UI
- Each of these routes appears in views
- Each of these actions generates and returns a complete HTML page

routes

```

accounts_signup.scala.html

```
public static Result signup()
{
   return ok(accounts_signup.render());
}
```

Signup

```
public class Accounts extends Controller
 private static final Form<User> userForm = Form.form(User.class);
 //...
 public static Result register()
    Form<User> boundForm = userForm.bindFromRequest();
    if(loginForm.hasErrors())
      return badRequest(accounts_login.render());
    else
      User user = boundForm.get();
      Logger.info ("User = " + user.toString());
      user.save();
      return ok(welcome_main.render());
```

Signup Form Processing

- Recover named form input items from request
- Extract these elements into a Java object

```
public class Accounts extends Controller
 private static final Form<User> userForm = Form.form(User.class);
 //...
 public static Result register()
    Form<User> boundForm = userForm.bindFromRequest();
    if(loginForm.nasErrors())
      return badRequest(accounts_login.render());
    else
      User user = boundForm.get();
      Logger.info ("User = " + user.toString());
      user.save();
      return ok(welcome_main.render());
```

GET

Sessions - login

- A globally
 accessible data
 structure into which
 we put details of
 'current' user.
- Read back this in other controllers to determine appropriate content

```
public class Accounts extends Controller
  private static final Form<User> loginForm = Form.form(User.class);
  //...
  public static Result authenticate()
    Form<User> boundForm = loginForm.bindFromRequest();
    if(loginForm.hasErrors())
      return badRequest(accounts_login.render());
    else
       session("email", boundForm.get().email);
       return redirect(routes.Dashboard.index());
  //...
```

- Not checking if user is valid!
- Should compare password/email with database, and only allow in of valid user credential presented

Sessions - Logout

- Destroy the session
- Redirect to Welcome page

```
public static Result logout()
{
    session().clear();
    return ok(welcome_main.render());
}
```

cycle	dunmore	56.0
walk	fenor	12.0

Activities

- Activities list sent to view
- Scala for loop to iterate over this list, and present in a table

```
public class Dashboard extends Controller
{
    //...
    public static Result index()
    {
        String email = session().get("email");
        User user = User.findByEmail(email);
        return ok(dashboard_main.render(user.activities));
    }
    //...
}
```

```
<form action="/submitactivity" method="POST">
  <h3 class="ui header">Enter Activity Details: </h3>
  <div class="field">
    <label>Type</label>
   <input type="text" name="kind">
  </div>
  <div class="field">
    <label>Location</label>
   <input type="text" name="location">
  </div>
<div class="field">
    <label>Distance
   <input type="number" name="distance">
  </div>
  <button class="ui blue submit button"> Upload </button>
</form>
```

Upload Activity

```
public class Dashboard extends Controller
 private static final Form<Activity> activityForm = Form.form(Activity.class);
  //...
  public static Result submitActivity()
    Form<Activity> boundForm = activityForm.bindFromRequest();
    Activity activity = boundForm.get();
    if(activityForm.hasErrors())
      return badRequest();
    String email = session().get("email");
    User user = User.findByEmail(email);
    user.activities.add(activity);
    user.save();
    return redirect (routes.Dashboard.index());
```

Upload Activity

Acquire the Activity object

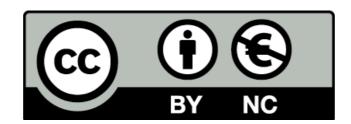

Ask the session who is 'logged in'

Add the new Activity to this users activities list

Save the updates

Back to dashboard

```
public static Result submitActivity()
   Form<Activity> boundForm = activityForm.bindFromRequest();
   Activity activity = boundForm.get();
   if(activityForm.hasErrors())
     return badRequest();
   String email = session().get("email");
   User user = User.findByEmail(email);
   user.activities.add(activity);
   user.save();
   return redirect (routes.Dashboard.index());
 }
```
